MEMORANDUM

SUBJECT: Syntex, Verona/Denney Farm MIS

FROM: Glenn Curtis *gmc*
REMD/SPFD

TO: Files

On June 30, 1988, Ralph Hazel and I talked with Bob Sawyer at the MIS. The MIS is currently warming up; the kiln is short 800 degrees and the SCC short 900 degrees of being hot enough to feed. Another four hours of heat up is anticipated; should be on line to feed material around noon. The ash gates had been installed and appeared to be functioning smoothly. Approximately eight hours were required for adjustment.

MBD is currently full. Last shipment from Verona was received June 28.

Spare parts inventory is ongoing. People will be onsite conducting the inventory through next week. A final report will soon follow.

We suggested to Bob that we need documentation regarding the established 3,200 lb/hr versus 2,500 lb/hr and the process by which it was arrived. In addition, documentation supporting the slagging effect caused by high salt in feed material is needed.

An agreement to purchase caustic appears eminent. A load should be delivered Tuesday, July 5, 1988.
